Soil Testing Recommendations

Soil sample depth for phosphorus (P), potassium (K), and zinc (Zn) recommendations is 0 to 4 inches.

Phosphorus ($P_2O_5$) recommendation

<table>
<thead>
<tr>
<th>pH</th>
<th>&lt; 9</th>
<th>9-16</th>
<th>17-25</th>
<th>26-50</th>
</tr>
</thead>
<tbody>
<tr>
<td>lbs of $P_2O_5$ per acre</td>
<td>70</td>
<td>60</td>
<td>50</td>
<td>0</td>
</tr>
<tr>
<td>≤ 6.5</td>
<td>50</td>
<td>40</td>
<td>30</td>
<td>0</td>
</tr>
</tbody>
</table>

Potassium ($K_2O$) recommendation

<table>
<thead>
<tr>
<th>Mehlich-3 Soil Test K (ppm)</th>
<th>&lt; 61</th>
<th>61-90</th>
<th>91-130</th>
<th>&gt; 130</th>
</tr>
</thead>
<tbody>
<tr>
<td>lbs of $K_2O$ per acre</td>
<td>120</td>
<td>90</td>
<td>60</td>
<td>0</td>
</tr>
</tbody>
</table>

Zinc (Zn) recommendation

- Zn deficiency normally occurs on silt or sandy loam soils or on precision graded fields.
- On these soils when soil-test Zn is < 4.1 ppm and pH is > 6.0, apply 10 lbs of actual Zn per acre as a granular fertilizer before rice emergence.
- Apply Zn seed treatments to supply 0.25 to 0.5 pounds of Zn per cwt of seed.
- For salvage of Zn deficiency, apply 1 pound actual Zn per acre as EDTA chelate to drained soil and fertilize with 100 lbs ammonium sulfate (AMS) and re-flood.
General optimum and absolute recommended seeding dates by geographic region in Arkansas are based on yield potential and management considerations.

<table>
<thead>
<tr>
<th>Geographic Region</th>
<th>Optimum&lt;sup&gt;1&lt;/sup&gt;</th>
<th>Recommended Absolute&lt;sup&gt;2&lt;/sup&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Begin</td>
<td>Cut-off</td>
</tr>
<tr>
<td>North</td>
<td>April 10</td>
<td>May 10</td>
</tr>
<tr>
<td>Central</td>
<td>April 1</td>
<td>May 15</td>
</tr>
<tr>
<td>South</td>
<td>March 28</td>
<td>May 20</td>
</tr>
</tbody>
</table>

<sup>1</sup> Seeding during the optimum time frame does NOT guarantee high yields or suggest that crop failure cannot occur when rice is seeded during these times.

<sup>2</sup> Recommended absolute does NOT mean that a successful rice crop cannot be grown if seeded outside of the dates listed. Success may be evaluated and/or interpreted using various parameters (i.e. cropping system, cash flow, field reclamation, etc.) and may differ among specific cultivars.
Rice Growth and Development Stages

**Germination**

- Seedling Emergence
  - 2nd Leaf
  - 3rd Leaf
  - 4th Leaf
  - 5th Leaf (1st Tiller)
- 2nd Tiller
- 3rd Tiller
- 4th Tiller

**Vegetative Stage**

- Panicle Initiation
- Panicle Differentiation

**Reproductive Stage**

- Heading (50% Head)
- Active Pollination and Egg Fertilization
- Milk Stage
- Scof Dough
- Medium Dough
- Hard Dough
- Maturation
- Maturity

**Elongation**

- Panicle 2mm Long, Visible to Naked Eye Upon Splitting Stem
- Active Tillering
- Lag Tillering
- Seed Food Depleted, Plant Dependent on Roots and Leaves

**Stages**

- 5-10 Days: 1st Internode
- 15 to 25 Days: 2nd Internode
- 24 to 42 Days: 3rd Internode
- 39 to 45 Days: 4th Internode

**Exceptions**

- Stage 3 begins when 50% of the florets are pollinated.
- Stage 4 begins when most of the grain is filled with moisture.

**Notes**

- Under warm conditions use the lesser number of days.
- Under cool conditions use the greater number of days.
Seeding, Emergence, & Plant Stands

Seeding:
- Ideally, plant when soil is 60°F @ 4 in. depth.
- Good seed-to-soil contact is required.
- Seed depth should be ¼ - 1 ½ in.
- Under favorable conditions, drilled seeding rate should be ~30 seeds per square foot (ft²) for conventional, non-hybrid cultivars and ~11 seeds per ft² for hybrids.
- Seeding methods include: dry seeded-drilled, dry seeded-broadcast and water seeded-broadcast.
- Recommended drill row widths are 4 to 10 inches; 7.5-inch drill-row widths are most common.
- In furrow irrigated rice, increase seeding rate by 10% to achieve faster canopy closure.

Determining Emergence & Final Plant Stands:
- DD50 Emergence – date when 10 plants per ft² have emerged above soil surface (4-5 plants per ft² for hybrids). [http://dd50.uaex.edu](http://dd50.uaex.edu)
- Count the number of plants in one ft² in at least 10 random locations in the field.
- Desired stand is 12 to 18 plants per ft² for conventional, non-hybrid cultivars and 6 to 10 plants per ft² for hybrids.
- Stand uniformity is as important as stand count.

Converting seed counts between seed per square foot and seed per row foot.

### Suggested hybrid final stand

### Suggested variety final stand

Research suggests final plant stands in the highlighted ranges are needed to regularly achieve optimum grain yields. However, failure to achieve these stand densities does not mean that a profitable crop cannot be produced at stands less than or greater than these described.

Stand densities less than 3 plants/ft² for hybrids and less than 5 plants/ft² for varieties may not result in a profitable net return. These situations need to be evaluated on a case-by-case basis to determine the profitability of keeping the existing crop versus replanting.
**Insecticide Seed Treatments for Rice**

Insecticide seed treatments are strongly recommended for rice. Research has shown a positive return 80% of the time when using an insecticide seed treatment. Select the appropriate product based on cost and insect control needs. However, grain yield, stand, and vigor benefits have been repeatedly noted even in the absence of insect pressure. Insect control benefits diminish greatly 35+ days after planting.

**Insecticide seed treatments for rice insect management.**

Fungicide Seed Treatments for Rice

It is strongly recommended that fungicide seed treatments be used to manage the seedling disease complex in rice. These seed treatments generally provide ~14 days of protection to enable plants to “out run” seedling disease issues. Prolonged cool, wet conditions may allow seedling disease to overcome the seed treatments.

<sup>z</sup>Conditions required for use of optimum single preflood N rate: 1) field can be flooded timely (<7 days); 2) preflood urea is treated with a recommended urease inhibitor that includes NBPT; or ammonium sulfate is used as the N source; 3) can maintain a 2– to 4-inch flood depth for at least 3 weeks following flood establishment, and 4) the preflood N must be applied uniformly across the field (no streaking).

<sup>y</sup>N rate for rice on silt loam soils following soybean in rotation. Rates may need adjustment based on factors below.

<sup>x</sup>Apply midseason N in one application a minimum of 3 weeks after the preflood N application AND internode elongation has started; both conditions must be met to receive maximum benefit from the midseason N.

<sup>w</sup>Hybrids receive additional N at late boot rather than midseason. Refer to DD50 for proper timing of this application.

<sup>v</sup>Total of 120 but may be split 75-45 or 90-30.

† Arborite AG-NT (Nitrolock Technology) distributed by Gavilon Fertilizer.
‡ Unknown, the product label does not specify the concentration of NBPT in the product.
§ ANVOL contains 16% NBPT and 27% duromide which has also been shown to reduce ammonia volatilization loss.
# Limus contains 16.88% NBPT and 5.63% NPPT, which is a proprietary inhibitor owned by BASF.

N-STaR or Nitrogen Soil Test for Rice

- N-STaR provides field-specific N rates for silt loam and clay soils.
- Silt loam soils (CEC less than 25) should be sampled to a depth of 18 inches.
- Clay soils (CEC greater than 25) should be sampled to a depth of 12 inches.
- Depth of sampling is extremely important - samples deeper or shallower than the prescribed depth can affect N recommendations.
- 10 samples are recommended per field, but a single sample should represent no more than 10 acres (e.g. a 50 acre field will need ten samples, but a 150 acre field should have at least 15 samples).
- Each individual sample is kept separate - do not aggregate!
- Cost is $10 per sample for analysis.
- For more information: nstarlab@uark.edu
Determining Rice Midseason N Needs Using Trimble® GreenSeeker® Handheld

Guide to rice midseason N applications using GreenSeeker (GS).

<table>
<thead>
<tr>
<th>Reference Plot GS Average</th>
<th>Apply Midseason N if Field GS Reading Less Than</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.80</td>
<td>0.70</td>

<td>0.65</td>
</tr>
<tr>
<td>0.70</td>
<td>0.61</td>
</tr>
<tr>
<td>0.65</td>
<td>0.56</td>
</tr>
</tbody>
</table>

Application recommendation based on greater than 50% chance of response to midseason nitrogen application. Valid for both varieties and hybrids.

Using GreenSeeker allows for making objective decisions on midseason N management in rice. Follow these steps to successfully use GreenSeeker in Rice:

- A **Reference Plot** (minimum 5’ x 5’ area) must be present in EVERY INDIVIDUAL FIELD. This Reference Plot should have 50-100 units of N more than the producer’s preflood N rate (only 30-60 grams needed or 1/4 - 1/3 of a standard measuring cup). The Reference Plot allows for a GreenSeeker reading to be taken in an area with maximum fertilizer N uptake. The larger the field, the more Reference Plots needed - i.e., one Reference Plot per 50 acres.

- GreenSeeker readings should be taken after Green Ring AND no earlier than 3 weeks following preflood N incorporation.

- GreenSeeker readings should be taken throughout the field – preferably a minimum of 10 readings – with each reading being an average of 10 steps (depress trigger while walking the 10 steps - resulting number will be an average of area covered).

- GreenSeeker readings are no longer valid once plants reach the late boot stage (flag leaf fully exserted).

- The average GreenSeeker reading from the Reference Plot is then divided by the average readings from the field. If the resulting value is greater than 1.15 then there is more than a 50% chance of a response to midseason N.

**Example** – a Reference Plot value of 0.8 divided by a field average value of 0.69 = 1.16. Since 1.16 is greater than 1.15, a response to midseason N will occur more than 50% of the time. The higher the ratio, the greater the chance of a response to midseason N applications.

**Note**: GreenSeeker responses may vary in furrow-irrigated rice due to different plant growth habit and changes in N fertilization strategies.

Apply permanent flood ~ the 5th leaf or 1st tiller stage.

Multiple Inlet Rice Irrigation (MIRI)

- MIRI reduces cold water effect and time and energy cost to flood up on precision and contour fields.
- Use 2.5" blue gates so adjustments can be made & all levees flood up evenly. Flow rate is 75 GPM.
- Measure flow with a meter or plumb bob:
  - Divide GPM by number of acres; then multiply by number of levees per acre; then divide by 75 GPM (flow rate per blue gate) to determine number of blue gates needed in each levee.
  - Ex. 1200 GPM / 42 A = 28 x 6 A per levee = 168 GPM needed / 75 GPM = 2.2 blue gates.
- To design MIRI use the mobile app (Rice Irrigation) or use Pipe Planner (www.pipeplanner.com).
- Use a wire to punch holes in pipe to prevent air entrapment. Set levee gates with 1-2 inch freeboard.
- Use 4" pipe about 3 feet long in bar ditches for multiple inlet (no pipe needed for side inlet).
- Do not overbuild levees where poly pipe will cross, pressure drop will prevent water from getting to end.

Alternate Wetting & Drying (AWD / Intermittent Flooding) Recommendations:

- Establish permanent flood as normal and maintain for 21 days.
- Keep soil wet or damp at top of paddy and bottom of paddy still flooded.
- Ensure adequate moisture at (1) internode elongation and (2) flowering and grain fill.

Furrow-Irrigated Rice (FIR) or Row Rice Recommendations:

- Construct a shallow bed, tall beds may require excessive irrigation. Prefer that space between furrows not exceed 30 inches for loam soils or 38 inches for clay soils.
- Begin irrigation and fertilization at the 5-leaf stage.
- End blocking can reduce water use and management time, but flooding should be kept very shallow and increased as rice height increases. This can be done by shutting off irrigation sets earlier.
- Soil moisture monitoring has been used successfully to assist in scheduling FIR irrigation. Place sensors shallow (surface or 4" to 8" depth) up to 18" depth. Couple with visual plant stress.
- Without sensors, producers generally have been successful with 3-5 days on soils that seal and longer (5-7 days) on soils that do not.

## Fungicide Rates & Timings for Disease Management in Arkansas Rice

### Fungicides for sheath blight management.

<table>
<thead>
<tr>
<th>Fungicide</th>
<th>Rate per Acre fl oz</th>
<th>Active Ingredients</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quadris</td>
<td>8.5 – 12.5</td>
<td>azoxystrobin</td>
<td>• Fungicides to control sheath blight should be applied when scouting indicates more than 35% positive stops in cultivars rated S or VS; or when more than 50% positive stops in cultivars rated MS.</td>
</tr>
<tr>
<td>Stratego</td>
<td>16.0 – 19.0</td>
<td>trifloxystrobin + propiconazole</td>
<td>• Scout between panicle differentiation and early heading.</td>
</tr>
<tr>
<td>GEM</td>
<td>3.8 – 4.7</td>
<td>trifloxystrobin</td>
<td>• Maximum benefit from a single fungicide application achieved when made before the disease has damaged the upper 3 leaves of the canopy.</td>
</tr>
<tr>
<td>Quilt Xcel</td>
<td>14.0 – 27.0</td>
<td>azoxystrobin + propiconazole</td>
<td></td>
</tr>
<tr>
<td>Elegia</td>
<td>32.0</td>
<td>flutolanil</td>
<td></td>
</tr>
<tr>
<td>Amistar Top</td>
<td>10.0 – 15.0</td>
<td>azoxystrobin + difenconazole</td>
<td></td>
</tr>
</tbody>
</table>

### Fungicides for prevention of kernel smut and false smut.

<table>
<thead>
<tr>
<th>Fungicide</th>
<th>Rate per Acre fl oz</th>
<th>Active Ingredients</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tilt 3.6 EC</td>
<td>6.0</td>
<td>propiconazole</td>
<td>• Apply at early to late boot but before heading begins to SUPPRESS kernel smut and/or false smut.</td>
</tr>
<tr>
<td>Propimax</td>
<td>6.0</td>
<td>propiconazole</td>
<td>• Applications made after heading starts will be INEFFECTIVE.</td>
</tr>
<tr>
<td>Stratego</td>
<td>19.0</td>
<td>trifloxystrobin + propiconazole</td>
<td>• Fields most likely to benefit will be those planted to a susceptible cultivar and using excessive nitrogen.</td>
</tr>
<tr>
<td>Quilt Xcel</td>
<td>21.0</td>
<td>azoxystrobin + propiconazole</td>
<td></td>
</tr>
<tr>
<td>Amistar Top</td>
<td>10.0 - 15.0</td>
<td>azoxystrobin + difenconazole</td>
<td></td>
</tr>
</tbody>
</table>

### Fungicides for prevention of neck blast.

<table>
<thead>
<tr>
<th>Fungicide</th>
<th>Rate per Acre fl oz</th>
<th>Active Ingredients</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quadris</td>
<td>10.0 - 12.5</td>
<td>azoxystrobin</td>
<td>• Keep flood depth at least 4 inches to suppress early leaf blast &amp; neck blast.</td>
</tr>
<tr>
<td>GEM</td>
<td>3.1 – 4.7</td>
<td>trifloxystrobin</td>
<td>• Fungicides for prevention of neck blast work best if applied <strong>twice</strong>:</td>
</tr>
<tr>
<td>Stratego</td>
<td>19.0</td>
<td>trifloxystrobin + propiconazole</td>
<td>◊ First application at late boot</td>
</tr>
<tr>
<td>Quilt Xcel</td>
<td>21.0 – 27.0</td>
<td>azoxystrobin + propiconazole</td>
<td>◊ Second application when panicles of main tillers are 50-75% emerged but the neck is still in the boot.</td>
</tr>
<tr>
<td>Amistar Top</td>
<td>15.0</td>
<td>azoxystrobin + difenconazole</td>
<td></td>
</tr>
</tbody>
</table>

* 21 oz of Quilt Xcel contains 6 oz of Tilt equivalent and 12 oz of Quadris equivalent.
* 19 oz of Stratego contains 5.5 oz of Tilt equivalent and 4.7 oz of GEM equivalent.

Reaction:  R = Resistant; MR = Moderately Resistant; MS = Moderately Susceptible; S = Susceptible; VS = Very Susceptible

Cells with no values indicate no definitive Arkansas disease rating information is available at this time. Reactions were determined based on historical and recent observations from test plots and grower fields across Arkansas and other rice states in southern USA. In general, these ratings represent expected cultivar reactions to disease under conditions that most favor severe disease development.
Insecticide Rates & Thresholds for Insect Management in Arkansas Rice

Insecticides for rice stink bug management.

<table>
<thead>
<tr>
<th>Insecticide</th>
<th>Min-Max Rate</th>
<th>Active Ingredients</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sevin 80 S</td>
<td>1.25 - 1.875 lb</td>
<td>Carbaryl</td>
<td>• Check infestation levels weekly or bi-weekly following 75% panicle emergence using a 15-inch diameter sweep net.</td>
</tr>
<tr>
<td>Sevin XLR or 4 F</td>
<td>2 - 3 pt</td>
<td>Carbaryl</td>
<td>• Apply insecticide when 5 or more stink bugs per 10 sweeps are present during the first 2 weeks after fields initially reach 75% panicle emergence; or when 10 stink bugs per 10 sweeps are present thereafter.</td>
</tr>
<tr>
<td>Tenchu 20 SG</td>
<td>7.5 - 10.5 oz</td>
<td>Dinotefuran</td>
<td>• Sampling stink bugs should be conducted between 8-10 a.m. and 6-8 p.m. to get the best estimate of the population. Repeat treatment as necessary to maintain control.</td>
</tr>

</table>

Thresholds for additional insect pests of rice.

<table>
<thead>
<tr>
<th>Insect</th>
<th>Threshold</th>
<th>Scouting Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chinch Bug</td>
<td>Treat when bugs are causing stand reduction</td>
<td>• Check seedling rice, particularly fields bordering wheat.</td>
</tr>
<tr>
<td>Fall Armyworm, True Armyworm</td>
<td>Treat when 6 or more armyworms per square foot early season. Late season treat when fall armyworms are damaging flag leaf.</td>
<td>• Early season watch rice bordering wheat for migration of true armyworms into field (damage can occur quickly when armyworms move in).</td>
</tr>
<tr>
<td>Grasshopper</td>
<td>Treat when damage is evident.</td>
<td>• Watch field borders, particularly near grassy areas.</td>
</tr>
<tr>
<td>Greenbug</td>
<td>2 to 3 greenbugs per plant on 1–to 2-leaf stage rice.</td>
<td>• General visual observation.</td>
</tr>
<tr>
<td>Rice Water Weevil</td>
<td>See MP144 for details.</td>
<td>• Inspect the youngest leaf on 40 rice plants at each stop for adult feeding scars. Avoid areas with thin stand. DO NOT count older leaves with scars.</td>
</tr>
</tbody>
</table>

Read and follow all label directions when using these products.
Drain Timing Recommendations
Drain rice based on two conditions, time AND maturity:
- Rice crop should be 25-30 days past 50% heading (25 days for long-grain, 30 days for medium grain).
- AND on silt loam soils panicles should have 2/3 straw-colored kernels; or on clay soils panicles should have 1/3 straw-colored kernels prior to draining.

Harvest Aids
Only use harvest aids when grain moisture is BELOW 25% and ABOVE 18%.
- Sodium chlorate at 3-6 lb a.i. per acre.
- Harvest within 5 days after application.
- Used to desiccate foliage but also reduces grain moisture.
- When used properly, does not reduce head rice yields.
- Hybrids may have a reduced window of safe application.

Harvest Timing and Grain Moisture
- Optimal harvest grain moisture for Long Grain Cultivars is 19 to 21 percent.
- Optimal harvest grain moisture for Medium Grain Cultivars is 22 to 24 percent.

Estimated Drying Costs Based on Grain Moisture Content

<table>
<thead>
<tr>
<th>Moisture Content (%)</th>

<tr>
<td>&gt; 22.0</td>
<td>0.60</td>
</tr>
</tbody>
</table>
Calibration and Conversion Factors

GPM = gallons per minute
GPA = gallons per acre
mph = miles per hour
W = nozzle spacing (in.) for broadcast spraying
 = spray width (in.) for single nozzle, banded or boomless spraying
 = row spacing (in.) divided by nozzles per row for directed spray

Formulas:

\[
\frac{\text{GPM}}{(\text{per nozzle})} = \frac{\text{GPA} \times \text{mph} \times W}{5,940}
\]

\[
\text{GPA} = \frac{5,940 \times \text{GPM (per nozzle)}}{\text{Mph} \times W}
\]
