

Installation and Configuration of the Cisco AnyConnect VPN on Windows Computers

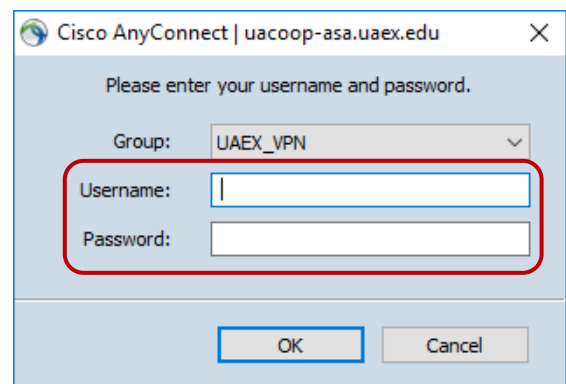

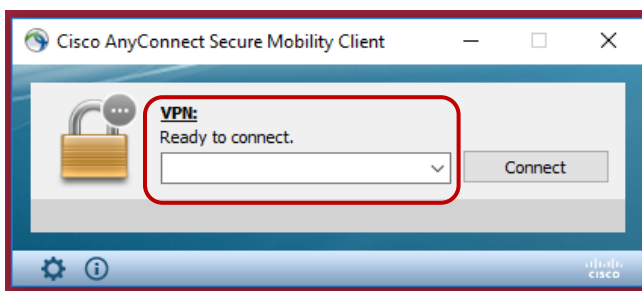

1. Download the Cisco AnyConnect client from our FTP server located here:
<ftp://ftp.uaex.edu/IT/AnyConnect%20Client/>

2. After the file is downloaded, install the client – taking all defaults.

3. Once the software is installed, locate the Cisco AnyConnect in the Programs list.
- a. You can pin it to the taskbar so it will be easier to locate when needed (bottom picture).
 - b. Click on the application to open it (right picture).

4. The Connect dialog appears. Enter the following into the connect field:
Uacoop-asa.uaex.edu

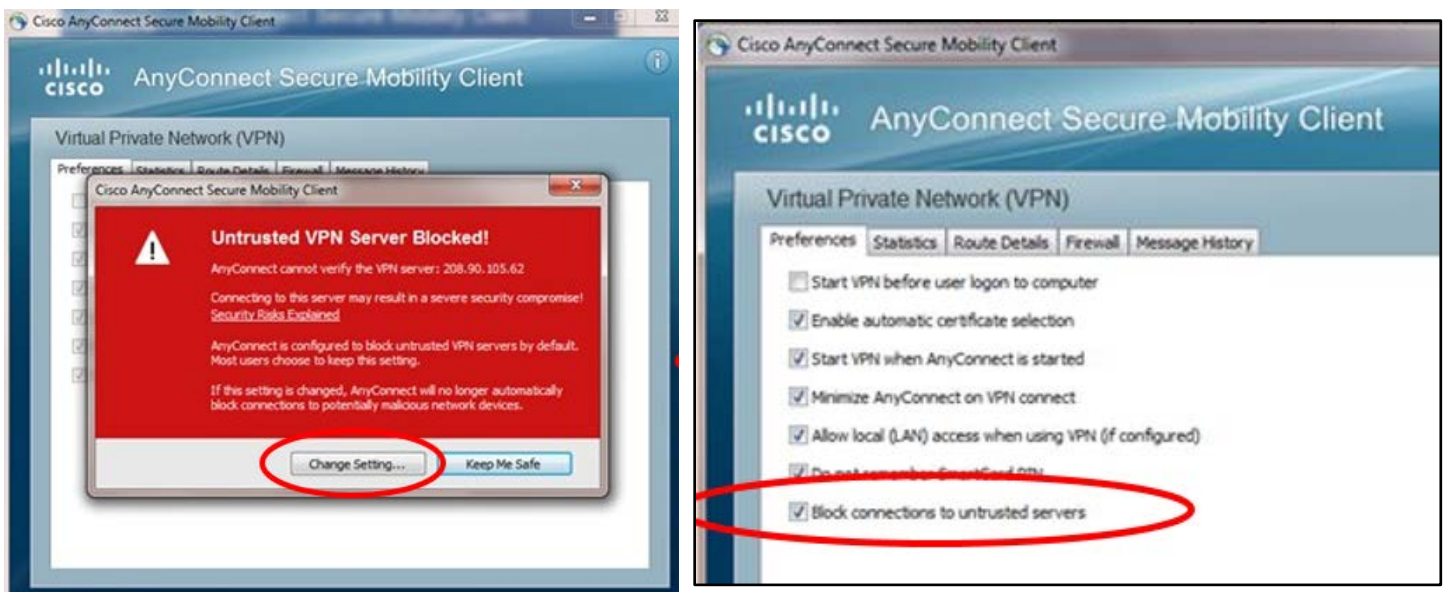

5. Enter your AD credentials into the login dialog.

6. You should now be connected to the VPN. You can confirm this by seeing the lock on the Cisco AnyConnect icon in the system tray (bottom right).

Note: The next time you try logging into the VPN you may encounter the following error “Untrusted VPN Server Blocked!

Just click on **Change Settings** and uncheck “**Block Connections to Untrusted Servers**”. You won’t see the error any longer.

Make sure to disconnect from the VPN when you have completed your work.
