Setting Up LRSO_GUEST (Unsecure) on Laptops

If you have any problems please contact the Call Center for assistance.

1. Click on the WIFI icon in the bottom right corner of your screen.

2. Click on LRSO_GUEST and then click on Connect.

3. After the connection to LRSO_GUEST is made, open a Browser to login. If you don’t see a login page or the certificate warning page, enter the following into the browser URL address field: http://1.1.1.1/login.html

4. You will be warned about a security certificate problem because it doesn’t match any of the ones currently on your computer but it is safe, click on Advanced and then Proceed.

5. You will then be presented with the login page, read through the Acceptable Use policy then enter your email address and click on Agree to login.

6. You should now be redirected to Yahoo.com. You can close this window and continue working as needed.

7. You are now connected to our unsecure LRSO_GUEST Wifi network. You will be required to login each time you connect.
