

Setting up 2X RDP Viewer on your iPad

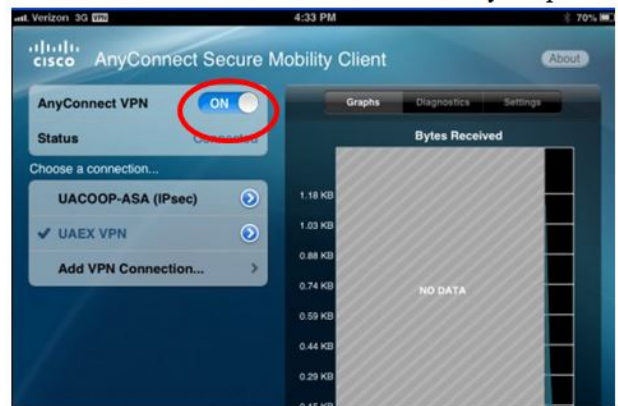

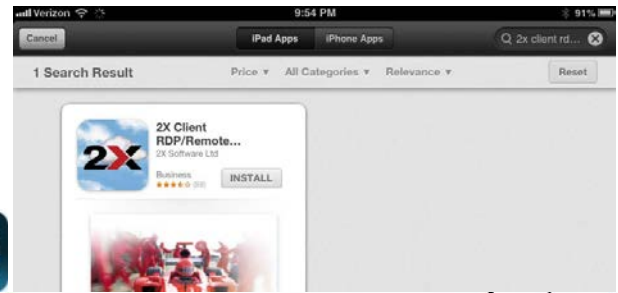

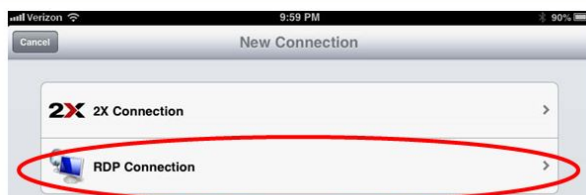

Note: Even though you can also use 2X Viewer on your iPhone, it is not recommended, the size of the screen limits your ability to do much.

1. Open the Apps Store and search for 2X and install it.
2. You must be connected to our VPN in order to remotely connect to your work computer.

If you haven't setup the VPN yet, please refer to the instructions for "Installing the Cisco AnyConnect VPN on iPad". Open the Cisco AnyConnect App.

3. Then slide the On\Off button to ON. Enter your password when prompted.
4. Open the 2X RDP Viewer and then click on the + sign to add a connection.

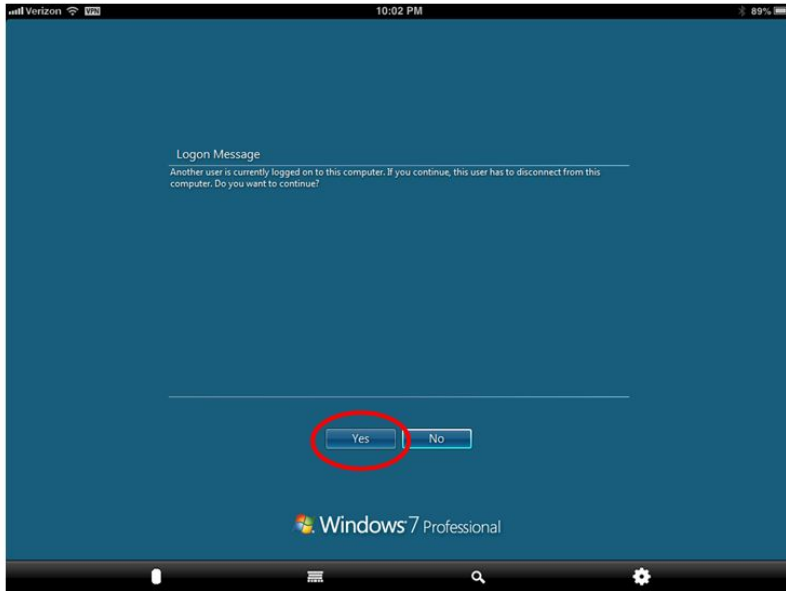

5. Choose RDP Connection.
6. Select each of the items below and enter the

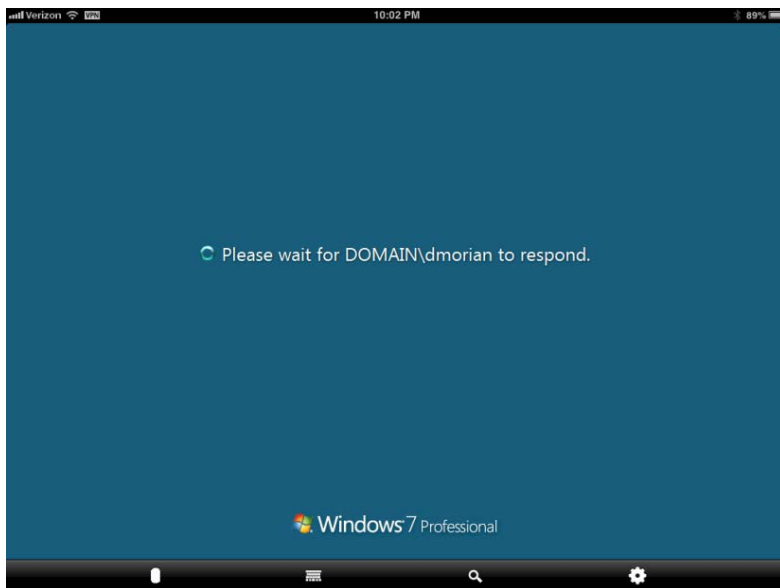

following information (save each item when done):

Alias – Give your connection a name. Save.
 Address – 10.200.167.xxx (This is the reserved IP number of your work computer). Save.
 Port – This should remain 3389
 Username – Your Windows username. Save.
 Password – Your Windows password. Save. If this password changes you will need to change it here as well.
 Don't change any other settings. Click on **SAVE** when finished.

7. Choose your newly created connection to turn the VPN on.
8. Once the connection is made to your host computer you may be presented with the following warning:

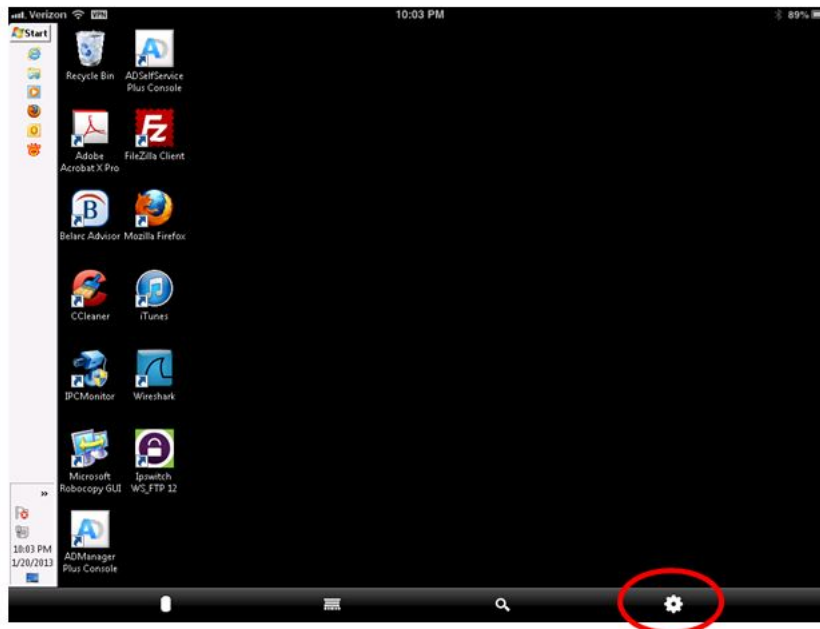

Just choose **Yes** to disconnect the user (which was actually you).

9. You should now see your host computer going through the login process.

10. When you are finished make sure you click on the Connection Symbol (bottom right corner) and choose Disconnect when you are done.

11. Also, make sure you disconnect from the Cisco AnyConnect VPN when you are finished.
